GPT-2 Large (Pearson r = 0.30)

n = 49,712

GPT-2 XL (Pearson r = 0.08)

n = 46,857

Pythia 1.4B (Pearson r = 0.04)

n = 50,239

Llama 3.1-8B (Pearson r = 0.21)

n = 123,060

25 of them outside this x range, not drawn

Qwen3-8B (Pearson r = 0.35)

n = 139,182

261 of them outside this x range, not drawn

Transition width W (final block, SLERP path)

SLERP path length (L2, block-0 output)

1 point

densest

Local point density (log scale; each panel scaled to its own densest spot)

Spearman rank correlation, path length vs W

-1 = perfect negative monotonic relationship

+1 = perfect positive monotonic relationship

GPT-2 Large +0.33

GPT-2 XL +0.10

Pythia 1.4B +0.02

Llama 3.1-8B +0.21

Qwen3-8B +0.35

0 = no monotonic relationship

Spearman correlation coefficient ρ

SLERP path injected at the block-0 output. Monotonic curve: the final-block readout curve crosses the 10% and the 90% level once each and never drops by more than 0.05 between neighbouring interpolation positions. r, rho and n count every monotonic curve, including the ones outside a cropped x range.
